

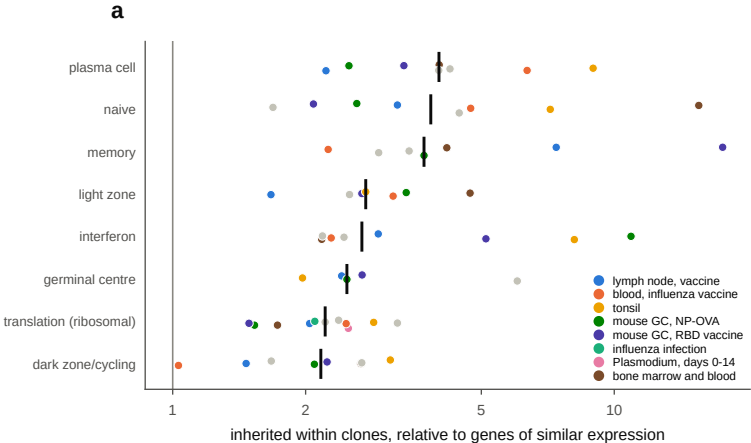

Figure 5 | Which parts of the B-cell programme are inherited within clones

Gene-level inheritance, measured against genes expressed at the same level.

Above 1: the genes of that programme are more clonally inherited than other genes expressed at the same level. One point per dataset; the line is the median across datasets.

Genes ranked by how much more of their variation is explained by clone identity than by shuffled clones. Receptor genes are excluded: they are clonal by definition.
