

Supplementary Figure 13 | Three state-enriched regions in the later-infection family map

GC, plasmablast and memory occupancy shown separately on identical clone coordinates.

A-C: every family is shown in every panel; colour changes only. Point size reflects captured-cell count.
D-F: each dot is a mouse; lines join group medians. Three mice per arm/date; controls excluded.
State enrichment and changing capture composition do not establish lineage direction or a future fate.
