

Supplementary Figure 8 | Historical Top2a display and current model-antigen GC state evidence

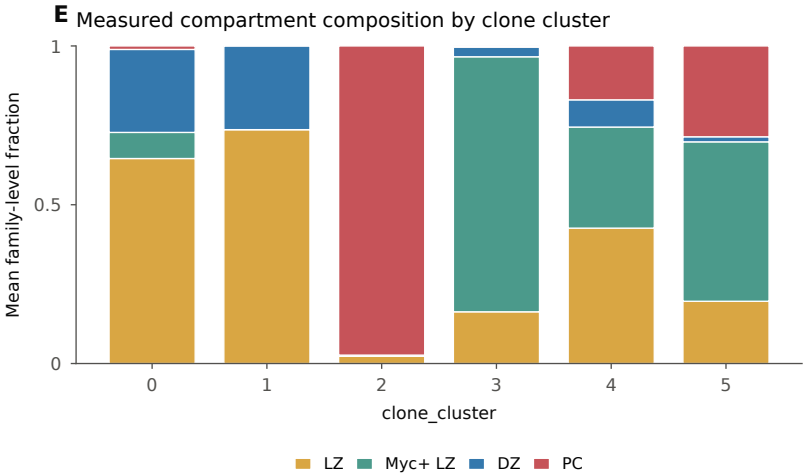

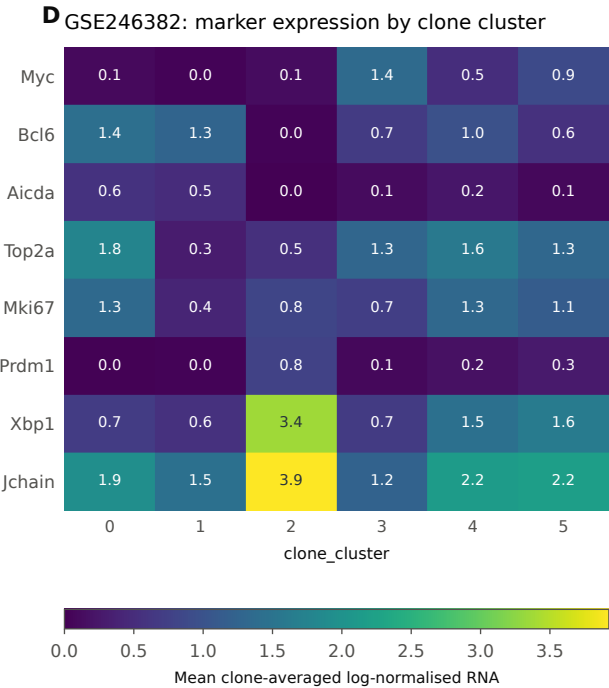

A is an archived output; B-E show reconstructed GSE246382 geometry, measured gates and descriptive RNA.

Notebook cell 33 output; cohort and sampling day unresolved.

New coordinates, same 377 V-D-J groups as Figure 2B.
Myc is averaged over captured members of each group.

F Scope of the reconstruction

377 same-mouse V-D-J groups; ≥ 1 cell.
UMAP $k=40$, $\text{min_dist}=0.65$; seed 123.
Scanpy graph $k=15$; Leiden $r=0.3$, seed 0.

Gates and markers annotate captured states.
They do not assign direction or future fate.
V-D-J groups can merge distinct junctions.
The 2D branch shape is parameter-dependent.

Selection/output interpretation is restricted
to this model-antigen GC application.
A remains a separate historical display.
