

Supplementary Figure 8 | Historical Top2a display and current model-antigen GC state evidence

A is an archived output; B-D are audited real-data GSE246382 views with measured gates and descriptive RNA.

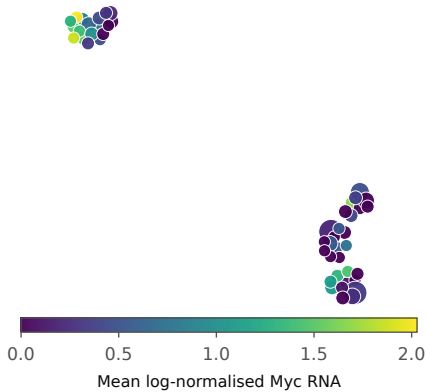

Notebook cell 33 output; cohort and sampling day unresolved.

B GSE246382: measured cell compartments

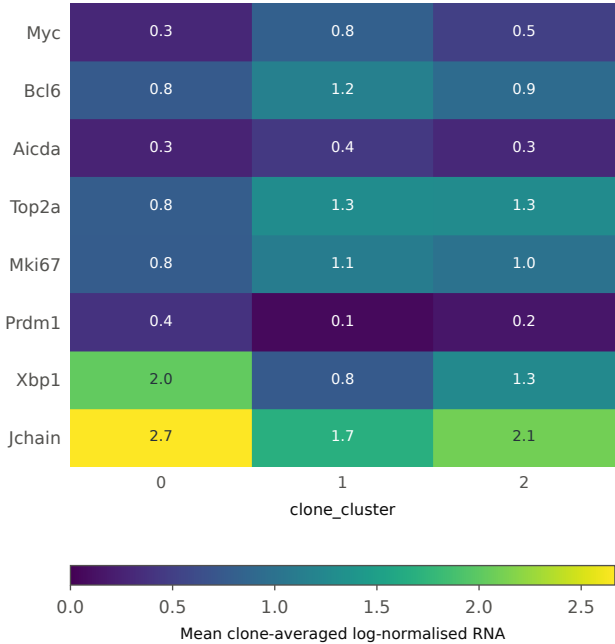

C GSE246382: mean Myc expression per clone

New clone coordinates, same 49 families as Figure 2B.
Myc is averaged over captured members of each family.

D GSE246382: marker expression by clone cluster

E Interpret the model-antigen GC nodes within their evidence

Cell-UMAP clone centroids → distance-row UMAP (20 neighbours, min_dist 0.4) → Scanpy graph (15) → Leiden (0.3).
Figure 2B colours three unsupervised clone clusters; gate labels and marker values do not enter the graph.
Cluster 1 is enriched for Myc+ LZ / DZ capture; cluster 0 has greater PC capture and plasma-cell-module expression.
Cluster 2 contains mixed GC/output states. Cluster annotations describe captured state biases, not future fates.
A is a separate historical display. B-D do not assign a differentiation direction or extend GC interpretation to non-GC.
