

Supplementary Figure 5 | Non-GC validation across marrow and blood

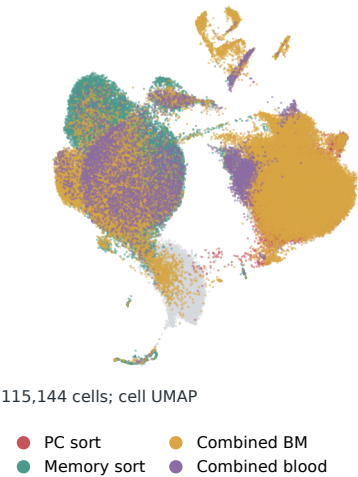

Verified single-donor libraries test whether ancestry and terminal state remain distinguishable.

A Compartment and antigen sorting are represented explicitly

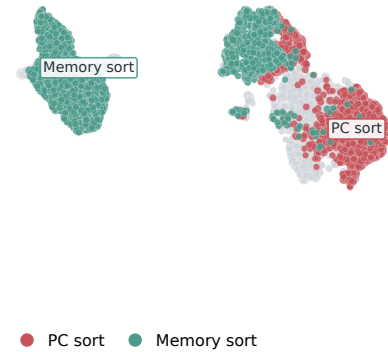

Clone membership is constrained to the actual donor; mixed sort gates are not pure cell fates.

B Cell compartments

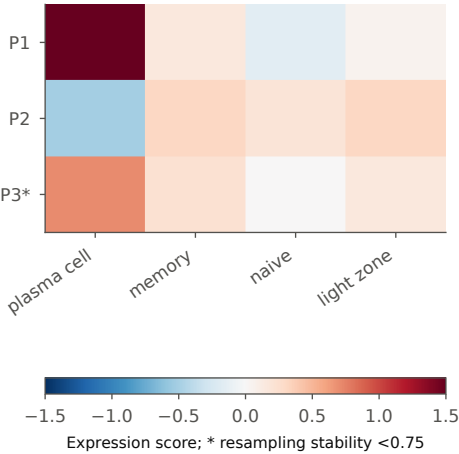

C Clone families by measured sort gate

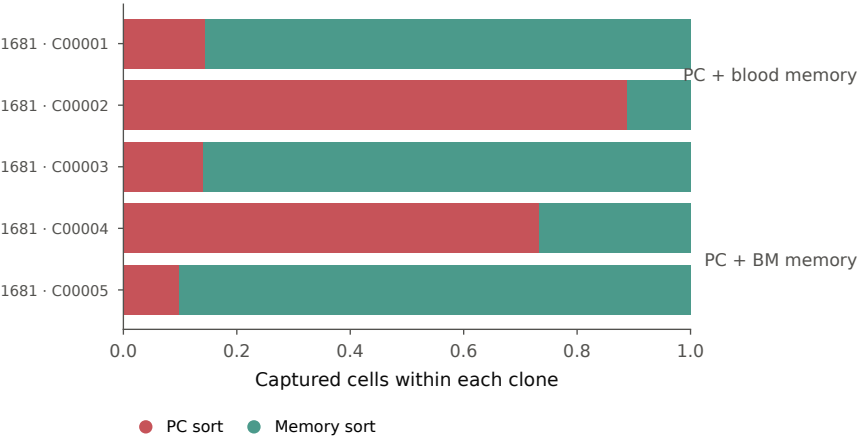

9,783 reliable clones; size reflects capture count.
Grey: combined or antigen-first sort majority.

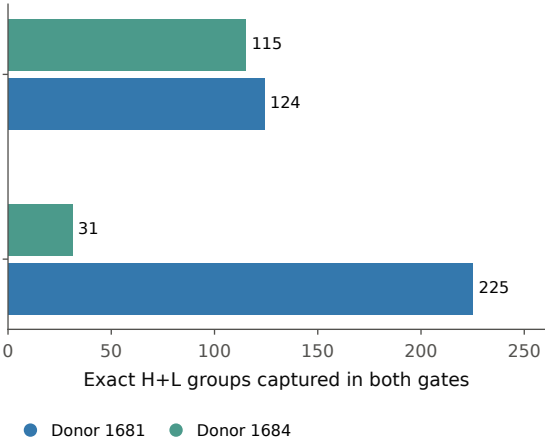

D Descriptive expression signatures

E Shared clones occupy distinct measured gates

F Identical heavy + light receptors across pure gates

Unique productive heavy + light chain per cell.
This supports common receptor identity, not fate direction.
