

Map review | Figure 3: unchanged coordinates, different biological views

The original early PB map is restored; a later GC map addresses a separate cohort.

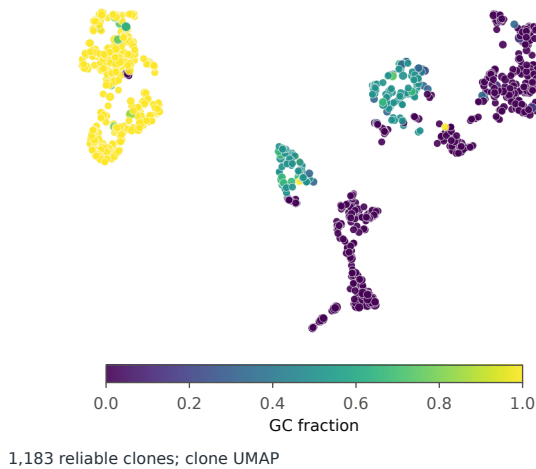

A Previous map: early cohort, PB colour

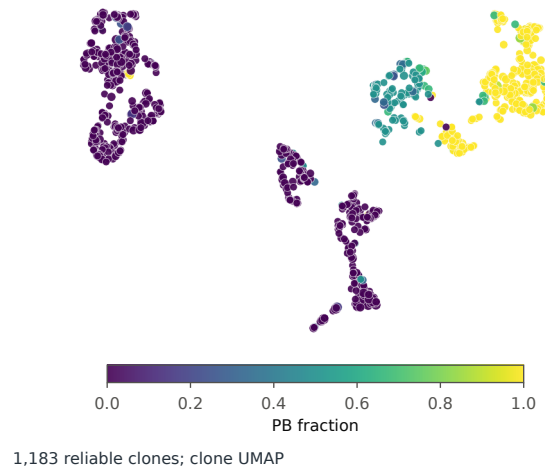

B Restored map: early cohort, PB colour

C Later cohort, GC colour

D Same later coordinates, PB colour

E Coordinate and membership audit

Early: 801 clones. Later: 1,183 clones. Clone IDs and cell membership match the pre-revision results.

Maximum absolute difference in saved clone and cell UMAP coordinates: 0 in both cohorts.

A/B differ in palette, colour-bar orientation and aspect; C/D differ only in the measured state used for colour.
