

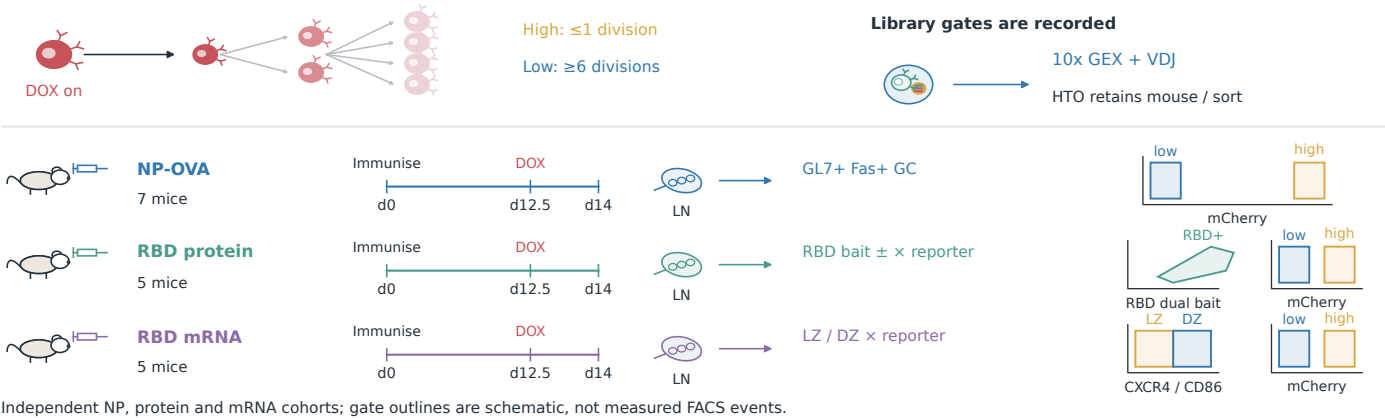

Figure 2 | Model-antigen GC state nodes and independent reporter measurements

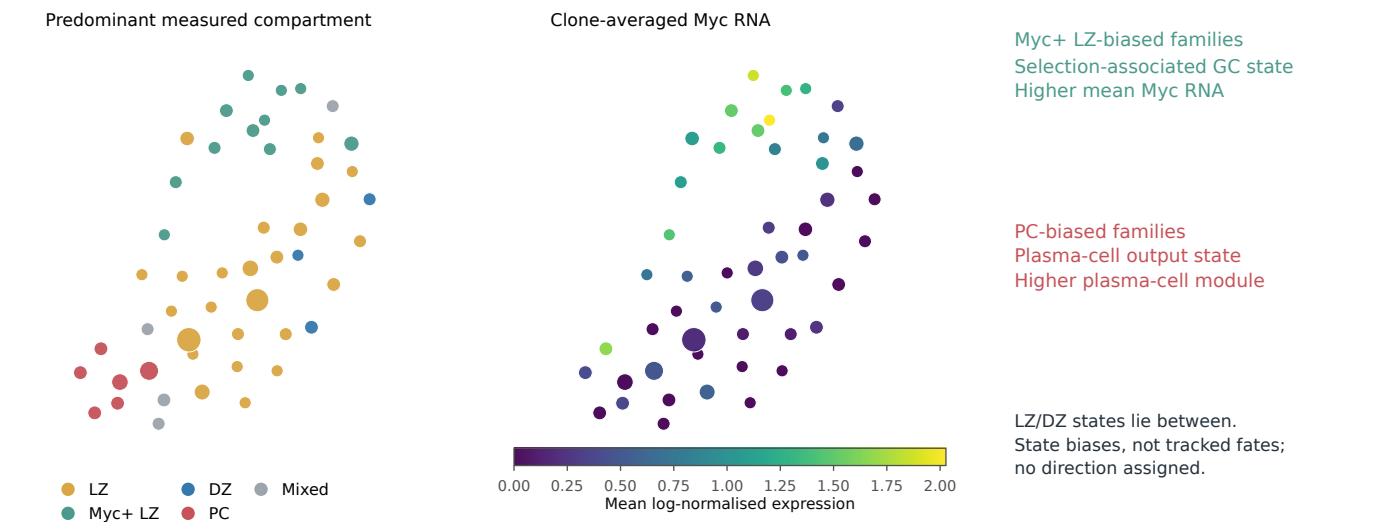

Real-data clone reclustering distinguishes selection-associated GC and plasma-cell output state biases.

A Independent NP-OVA and RBD reporter designs

H2B-mCherry reporter: stop synthesis, read 36 h of division history

B NP-OVA day 14: GC and output-associated clone states

GSE246382: 49 same-mouse sequence-defined families / 260 cells; ≥3 cells per family; area follows capture count.

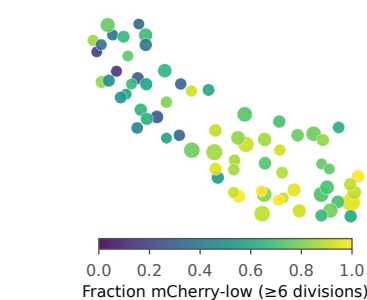

Separate reporter evidence

NP-OVA division reporter
36-hour H2B-mCherry window

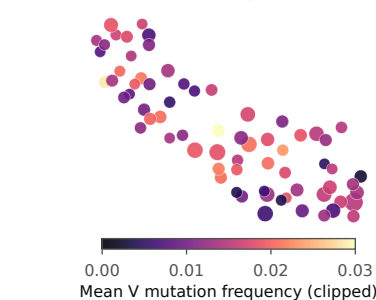

C: measured division bias
D: receptor mutation history

Independent of the B cohort.

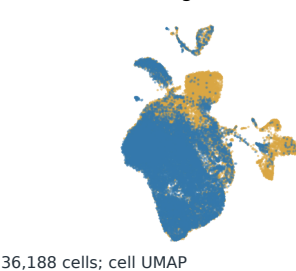

C NP-OVA: division-associated clone-state bias

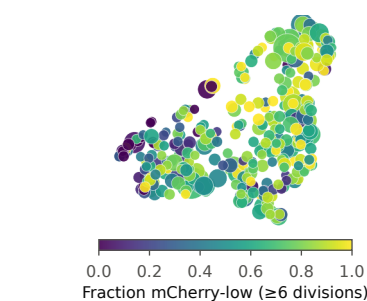

D NP-OVA: mutation history on the same clone map

E RBD: cell division gate

F RBD: division-associated clone-state bias

G RBD: mutation history on the same clone map
