

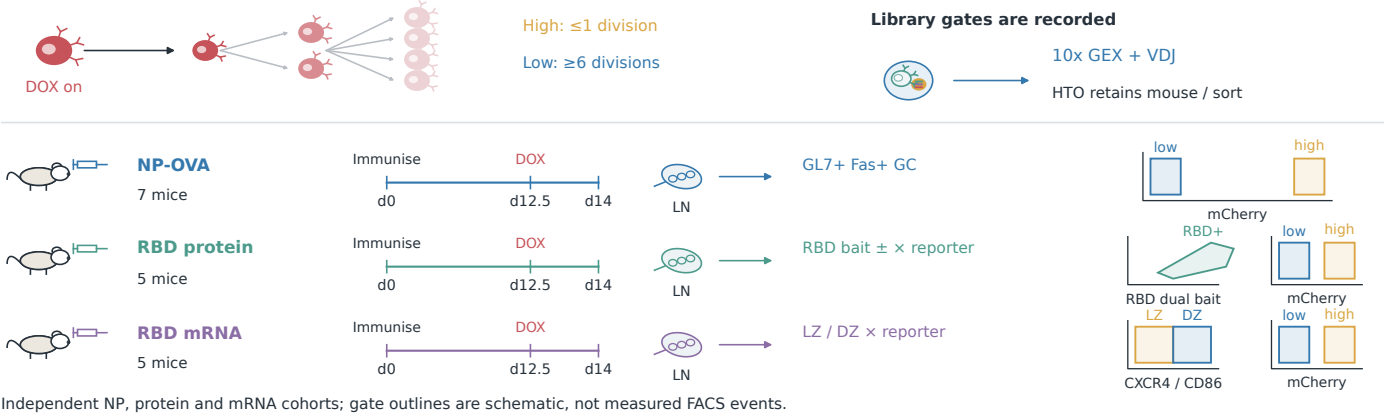

Figure 2 | A model-antigen GC state fork and independent reporter measurements

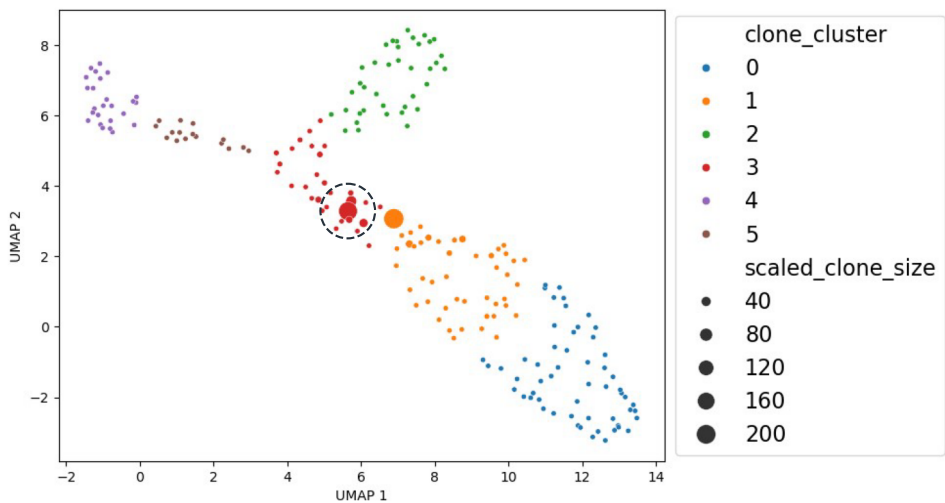

Selection/output hypotheses from NP-OVA clone states; reporter cohorts provide separate measured anchors.

A Independent NP-OVA and RBD reporter designs

H2B-mCherry reporter: stop synthesis, read 36 h of division history

B NP-OVA day 14: clone reclustering reveals a state fork

GSE246382; original report Figure 2.11. One point per historical clone; size is scaled capture count.

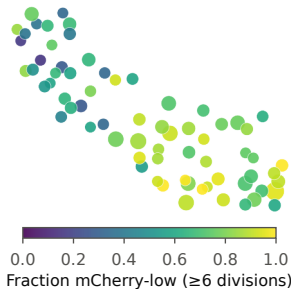

Separate reporter evidence

NP-OVA division reporter
36-hour H2B-mCherry window

C: measured division bias
D: receptor mutation history

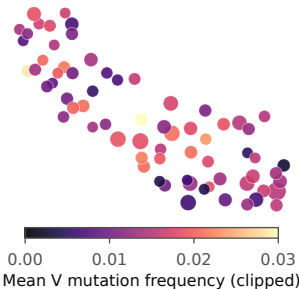

Independent of the B cohort.

C NP-OVA: division-associated clone-state bias

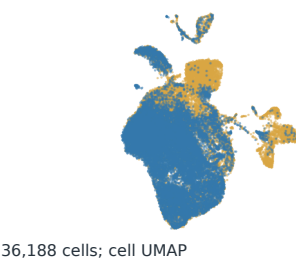

69 reliable clones; clone UMAP

D NP-OVA: mutation history on the same clone map

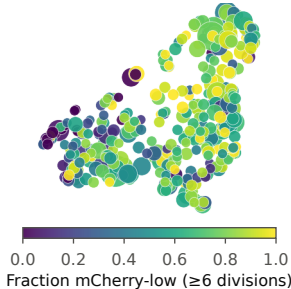

69 reliable clones; clone UMAP

E RBD: cell division gate

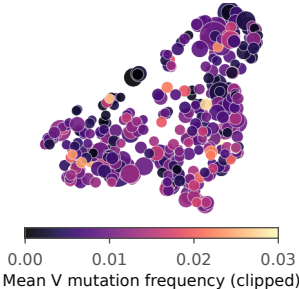

36,188 cells; cell UMAP

F RBD: division-associated clone-state bias

381 reliable clones; clone UMAP

G RBD: mutation history on the same clone map

381 reliable clones; clone UMAP
